No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 25,

Disclosure; SEQ ID NO 79; 164pp; French

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of

```
ö
these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGP-IR and/or EGPR. This sequence represents a protein sequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Insulin-like growth factor 1 receptor; antibody; tumor; cytostatic; neoplasm; prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obstetrics; breast tumor; endometroid carcinoma; gastrointestinal disease; colon tumor; antipsoriatic; psoriasis; dermatological disease; immune disorder; heavy chain variable region.

The inversion relates to a novel isolated anti-insularity being capable of binding to human IGF-IR and, if necessary, capable of capable of binding to human IGF-IR and, if necessary, capable of capable of binding tromaine kinase activity of the receptor, comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADZ67006 and ADZ67014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGFR, and/or connected with a cativation of the IGF-IR and/or EGFR, and/or of EGF with EGFR, where the administration of the medicament does not induce or only slightly induced intended of the antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral capendary effects connected with inhibitions of the insulin receptor. The antibody is useful for preparation of a medicament intended to inhibit the graparation of a medicament and/or EGF-dependent and/or EGF-dependent and/or HER2/neu-dependent and/or IGF2-dependent and/or IGF2-dependent and/or IGF2-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent cells. (I) is useful in the preparation of a medicament intended for prevention or for the treatment of psoriasis. (I) is useful in the preparation of a medicament intended for the special or the preparation of a medicament intended for the preparation of a medicament intended for the specific targeting of a biologically active compound to intended for the specific targeting of a biologically active compound to intended for the specific targeting of a biologically active compound to intended for the specific targeting of inten
novel isolated anti-insulin-like growth factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of IGF-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

Agentation of the transduction pathway of the signal mediated by the interaction of the transduction pathway of the signal mediated by the interaction of the transduction pathway of the signal mediated by the interaction of the medicament does not induce or only slightly induces secondary effects connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral character, preferably 1GF-dependent, especially IGF1 and/or 1GF2-dependent and/or HERZ/neu-dependent cells. [I) is useful for preparation of a medicament intended to inhibit the growth capecially IGF1-and/or IGF2-dependent and/or EGF-dependent and/or IGF2-dependent and/or IGF2-dependent and/or IGF2-dependent and/or IGF3-dependent cells. [I) is useful in the preparation of a medicament intended for prevention or for the treatment of cancer, where the cancer is chosen from prostate cancer, osteosarcom, lung cancer, breast cancer, endometrial cancer or colon cancer. [I) is useful in the preparation of a medicament intended for the specific targeting of a biologically active compound to cells expressing or overexpressing the IGF-IR and/or EGFR receptor. [I] is useful for in vitro diagnosis of illnesses induced by an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       overexpression or an underexpression of the IGF-IR and/or EGFR receptor starting from a biological sample in which the abnormal presence, of IGF-IR and/or EGFR receptor is suspected, which involves contacting the biological sample with (I), which is optionally labeled. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of specifically inhibiting to kinase activity of the receptor, comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADZ67006 and ADZ67014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGFR, and/or connected with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody or its functional fragment, being capable of binding human IGF-IR and specifically inhibiting tyrosine kinase activity of receptor,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Duflos A, Haeuw J,

Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with these receptors with their ligands. Bspecially they inhibit transformation of normal cells, so are useful against cancers of the proliferation of tumor cells, so are useful against cancers of the prostate. Jung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are a slo used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a

Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transformation of tumor cells, so are useful against cancers of the proliferation of tumor cells, so are useful against cancers of the prostate. I ung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are a slso used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel isolated anti-insulin-like growth factor a receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of specifically inhibiting tyrosine kinase activity of the receptor, comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined if amino acids (ADZ67006 and ADZ67014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal hyperactivation of the IGF-IR and/or EGFR, and/or connected with a hyperactivation of the transduction pathway of the signal mediated by the interaction of IGF1 or IGF2 with IGF-IR and/or of EGF with EGFR, where

fragments, that bind to human insulan-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulan-like growth factor-1 receptor (IGF-IR) and optionally: (ii) inhibit natural binding of insulan-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or considerated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with the insulant in their ligands. Especially they inhibit cransformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a protein sequence used to generate the Ab of the invention. The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of specifically inhibiting to have activity of the receptor, capable of specifically inhibiting tyroshine kinase activity of the receptor, of specifically inhibiting tyroshine kinase activity of the receptor, comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADS67006 and ADS67014). An antibody of the invention is useful in a cativation of a medicament intended of the preraction of a medicament intended of an illness connected with an overexpression and/or a bnormal colf an illness connected with IGF-IR and/or CGF at illness connected with IGF-IR and/or GFF with EGFW, where contraction of the IGF-IR and/or EGFW, and/or of EGF with EGFW, where interaction of the medicament does not induce or only slightly induces secondary effects connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended to inhibit the preparation of a medicament intended to inhibit the growth capecially IGF-dependent and/or EGF-dependent of a medicament intended for prevention of the preparation of a medicament intended for prevention or for the treatment of general endometrial cancer or colon cancer. (I) is useful in the preparation of a medicament intended for the presention of a medicament intended for the presention of a medicament intended for the specific targeting of a biologically active compound to the specific targeting of a medicament intended for the specific targeting of the IGF-IR and/or EGFR receptor. (I) is useful for in vitro diagnosis of illnesses induced to the specific targeting the IGF-IR and/or EGFR receptor is useful for in vit

```
The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF-IR) and/or -2; and/or (ii) inhibit specifically tyrosine chinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (IGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit contains formation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteoaarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused to by abnormal expression of IGF-IR and/or EGFR. This sequence represents a
                                                                                                                                 insulin-like growth factor-1 receptor; IGF-1R; tyrosine kinase activity, or epidermal growth factor receptor; EGFR; signal transduction pathway; ligand; tumor; cancer; osteosarcoma; complementarity determining region; CDR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
